Professional Summary

Mid-level Full-Stack Engineer with solid experience building commercial web applications, SaaS systems, and full-stack business platforms. Proficient in frontend development, backend API design, database architecture, asynchronous task processing, user permission systems, and third-party service integration.

Able to independently develop and deploy complete business projects from 0 to 1. Skilled at solving real-world development problems such as file processing, data statistics, user subscription, backend management, and frontend interactive optimization. Seeking full-time Remote Full-Stack Engineer roles.

Technical Skills

Frontend: Vue3, Next.js, TypeScript, Pinia, TailwindCSS, Element Plus, Responsive Layout

Backend: Node.js, NestJS, Express, RESTful API, WebSocket, JWT Authentication

Database & Cache: PostgreSQL, MySQL, Redis, Basic Caching Strategy

Task Processing: Redis Queue, Asynchronous Task Processing, Scheduled Tasks

DevOps: Git, Docker, Docker Compose, Server Deployment

Business Integration: Stripe Payment, Webhook Handling, File Storage, Email Notification

Project Experience (5 Standard Mid-Level Full-Stack Projects)

1. Multi-Tenant Team Document Collaboration Platform | Full-Stack

A lightweight enterprise document collaboration system supporting team management, real-time editing, file management, and permission control, suitable for internal team office

scenarios.

- Built user registration, login, password reset, and team invitation functions based on JWT authentication
- Designed RBAC permission system, including super admin, team admin, and ordinary member roles
- Implemented document creation, online editing, version history, recovery, and real-time data synchronization
- Developed file upload, preview, classification management, and trash recovery functions

Highlights: Real collaboration business, complete permission system, standard enterprise-level CRUD structure

2. AI Smart Q&A SaaS System (RAG Document Chat) | Full-Stack

A practical commercial AI document question-and-answer platform, allowing users to upload documents and perform intelligent dialogue retrieval.

- Implemented PDF and Markdown document upload, parsing, text chunking, and vector embedding storage
- Built RAG retrieval logic to implement accurate document Q&A and source content tracing
- Developed user usage statistics, free quota limits, and membership subscription functions
- Used asynchronous queues to process slow document parsing tasks to avoid interface blocking

Highlights: Popular full-stack AI business, asynchronous processing, complete user quota mechanism

3. Enterprise Background Management System | Full-Stack

Universal enterprise backend management platform, including user management, data statistics, log auditing, and system configuration.

- Implemented dynamic routing, menu permission control, and button-level permission management
- Developed user management, role management, and department management modules
- Built data dashboard, visual statistical charts, and system operation log records
- Completed system parameter configuration, dictionary management, and operation audit records

Highlights: Standard enterprise backend, most frequently asked in full-stack interviews

4. Content Scheduling & Publishing Tool | Full-Stack

A practical tool for content creators to manage articles, schedule posts, and view data analysis.

- Implemented article editing, draft saving, scheduled release, and content classification management
- Used scheduled tasks to automatically publish content and record task execution status
- Built data statistics module to count views, likes, and user access trends
- Integrated email notification to remind users of task completion and abnormal status

Highlights: Practical business scenario, scheduled task processing, data statistics capability

5. Personal Membership & Payment Closed-Loop Website | Full-Stack

A complete commercial closed-loop website with membership levels, online payment, order management, and billing records.

- Built user center, membership level system, and daily sign-in reward mechanism
- Integrated Stripe payment interface to realize online subscription and one-time payment
- Handled payment webhook callback verification and order status automatic update
- Developed order management, bill records, refund application and audit process

Highlights: Complete commercial closed-loop, payment integration, standard business logic

Self Evaluation

Proficient in full-stack development from frontend business implementation to backend API development, database design, and online deployment. Familiar with common business development scenarios such as permission management, asynchronous task processing, payment integration, and data statistics. Able to independently complete full-link project development, solve daily technical problems efficiently, and quickly adapt to full-stack development work in enterprise teams.
